

Finescreen General

The demands for cooling and process water by major industries, power stations, waste-to-energy plants, oil refineries, LNG plants etc. is continually increasing. For a number of reasons the supply of water will depend on the rivers and the seas. In view of this background a team of Hubert specialists has been engaged on research into an economical application for water-intake-screens for different levels. Based on this research and proven technology Hubert has developed series of screens. All Hubert water-intake-screens are consisting of standard components. The design and materials used are selected for extreme reliability, low maintenance and long lifetime.

- **DRUMSCREENS.**

The Hubert drumscreens are designed with patented A-shaped spokes resulting in high rigidity and resistance to deformation.

- **TRAVELING BANDSCREEN.**

The Hubert traveling bandscreens require only small installation areas due to their vertical construction and can handle large differences in waterlevels.

- **MICROSCREEN.**

The Hubert microscreens are applied in places where high demands are made on the purity of surface, process and re-circulated water.

Finescreen General

Additional Equipment and Services

Hubert can supply all the equipment needed for a complete cooling water intake including:

- several type of coarse barscreens
- stoplogs
- wash water systems, wash water pumps and pipework.
- control equipment
- cathodic protection systems
- installation
- supervision and commissioning

Be informed that our services are not limited to the engineering and manufacturing of our machinery's and equipment. Hubert is also your reliable partner for the erection, start-up, service and maintenance of our machinery's and equipment, worldwide.
